### **Introduction**

**D**uring the past 30 years, rural Midwest states have put considerable effort and resources toward programs and policies to boost their economic development. However, few have experienced significant economic success. Most rural counties have not prospered in proportion to the amount of resources devoted to development.

A recent Bureau of Business Research study reviewed the economic vitality of Nebraska's 93 counties, and selected counties in Iowa, Kansas, and Missouri—218, in all (Figure 1). The relationships between vitality, economic size, and location were analyzed. Vitality is determined by weighing several economic factors, population determines economic size, and location refers to a county's proximity to growth factors, such as an interstate highway or a metro area.

No single factor can accurately measure economic vitality. But, the economic factors used in this analysis

historically have proven useful in determining the health of an economic area. For that reason three income-related factors—wage and salary earnings, proprietors' income, and per capita food stamp dollars issued—and four job-related factors—employment growth, unemployment rate, private sector jobs, and population density—were selected to measure the economic vitality of these counties.

County-level data were compiled for each of the seven factors. Data for 1999 were used for wage and salary earnings, proprietors' income, per capita food stamp dollars issued, private sector jobs, and population density. Average unemployment rates were analyzed for the 1998-2000 period. Employment growth rates were calculated based on the percent change from 1995 to 1999. The counties then were ranked on the basis of each factor and criteria were developed to identify those counties that displayed the most/least economic vitality (Table 1, page 2).

**Figure 1**  
**Selected Midwest Counties**

## Counties with the Most Economic Vitality

Four of the seven counties with the most vitality are metro counties (Table 2 and Figure 2). The Kansas City, MO-KS metro area comprises three of the four—Platte County and Clay County, MO and Johnson County, KS. Dallas County, IA is part of the Des Moines, IA metro area. Two of the three rural counties with the most economic vitality are large trade centers—Plymouth County, IA, that borders the Sioux City, IA-NE metro area, and York County, NE that does not border a metro area. McPherson County, KS is a small trade center that borders the Wichita, KS metro area.

**Table 1**  
**Economic Vitality Criteria**

**Counties with the Most Economic Vitality**

- M-1 Counties that ranked in the top quartile for all seven factors
- M-2 Counties that ranked in the top quartile for six of the seven factors
- M-3 Counties that ranked in the top quartile for five of the seven factors

**Counties with the Least Economic Vitality**

- L-1 Counties that ranked in the bottom quartile for all seven factors
- L-2 Counties that ranked in the bottom quartile for six of the seven factors
- L-3 Counties that ranked in the bottom quartile for five of the seven factors

The only variable that hindered Platte County, MO (M-2) from joining Johnson County, KS in the top category (M-1) was its proprietors' income. Proprietors in Johnson County, KS had average incomes of \$26,500 in 1999 but proprietors in Platte County, MO had average incomes of just over \$18,000.

Five counties were classified in the M-3 category. Clay County, MO fell into the M-3 category because of high unemployment and per capita food stamp dollar distribution. Plymouth County, IA had low proprietors' income and high unemployment. York County, NE had low population density. Dallas County, IA had high per capita food stamp dollar distribution and low proprietors' income. McPherson County, KS had high unemployment and low employment growth.

Nebraska is the only state whose metro counties did not have at least five of the seven factors in the top category. Overall, Nebraska metro areas had low wage and salary earnings, low employment growth, and distributed more food stamps dollars per capita. However, these differences were negligible.

Some counties—Wyandotte County, KS, for example—have older, mature economies, while others have newer, growing economies, such as its neighbor, Johnson County, KS. Factors that impact a county's economy vitality are its degree of maturity, county border size, and the inclination of people and businesses to sprawl to the less crowded parts of the county. Wyandotte County, developed earlier and its growth overflowed into Johnson County. In contrast, Douglas County, NE has a mix of both economy types, partly due to its size. The eastern portion of Douglas County has older, more mature development and the growth has flowed to the western part of the county.

**Figure 2**  
**Counties with the Most Vitality**

**Table 2  
County Vitality Rankings**

<i>Counties with the Most Vitality</i>		
<b>M-1</b> Johnson County, Kansas	<b>M-2</b> Platte County, Missouri	<b>M-3</b> Clay County, Missouri Plymouth County, Iowa York County, Nebraska Dallas County, Iowa McPherson County, Kansas
<i>Counties with the Least Vitality</i>		
<b>L-1</b> none	<b>L-2</b> Worth County, Missouri	<b>L-3</b> Morrill County, Nebraska

**Counties with the Least Economic Vitality**

Two counties—Morrill County, NE and Worth County, MO—were found to have the least economic vitality (Table 2 and Figure 3). Neither of these counties is part of or adjacent to a metro area and neither has an interstate highway. But, they are adjacent to counties that do. None of the counties were found to have the least vitality in all seven factors considered.

Morrill County, NE had sufficient proprietors' income and employment growth to reach the L-3 category. Worth County, MO (L-2) had enough population density to keep it from falling into the L-1 category.

**Conclusion**

The study results indicate that counties with the most economic vitality share similar characteristics relative to vitality, economic size, and location. Counties that either are adjacent to or part of metro areas and have interstate highways are more likely to experience greater economic vitality than their rural neighbors. When it comes to economic vitality, location is key. Counties that had the least economic vitality are rural, without direct interstate highway access. Others that are adjacent to large trade centers or metro areas still do not thrive economically, indicating that other factors may inhibit their progress. The compounding characteristics of economic vitality affect each county differently.

## Economic Vitality Rankings of Nebraska Counties

The following table shows the economic vitality factor rankings of Nebraska counties. These ranked values are inversely proportionate to the actual value—the higher the rank, the lower the actual value.

	<i>Wage &amp; Salary Earnings</i>	<i>Proprietors' Income</i>	<i>Food Stamps Disbursed</i>	<i>Unemployment Rate</i>	<i>Employment Growth</i>	<i>Private Sector Jobs</i>	<i>Population Density</i>

## Note on Net Taxable Retail Sales

Users of this series should be aware that taxable retail sales are not generated exclusively by traditional outlets such as clothing, discount, and hardware stores. While businesses classified as retail trade firms account for, on average, slightly more than half of total taxable sales, sizable portions of taxable sales are generated by service establishments, electric and gas utilities, wholesalers, telephone and cable companies, and manufacturers.
